

# Botox<sup>®</sup>, Dysport, and Dermal Filler Treatments

## How It Works

These treatments work by injecting FDA-approved substances deep into the skin to reduce fine lines and wrinkles. Botox<sup>®</sup> and Dysport temporarily reduce muscle movement that causes facial lines, smoothing the skin around the injection site. Dermal fillers introduce hyaluronic acid to restore volume and hydration, softening the skin's appearance.

## How to Prepare

If you are receiving Botox<sup>®</sup> or a dermal filler, alcohol needs to be avoided 24-48 hours beforehand. As well as when receiving dermal fillers to avoid herbal supplements, multivitamins, caffeine, energy drinks, blood thinners, etc. Make sure to book your free consultation, and then choose a time to come in for your first session!

## After Your Session

Whether you receive Botox<sup>®</sup> or a dermal filler, you'll be advised not to engage in strenuous activity for 24 to 48 hours after your session. With Botox<sup>®</sup>, you'll also be instructed to avoid lying down for 4 hours after the procedure.

## Results & Maintenance

**Dermal Filler** – As fillers are designed to add volume, you can look forward to immediate fullness. Depending on the type of filler used and your metabolism, the results can last anywhere from 6 months to 2 years.

## What to Expect

At your session, we'll cleanse your skin and review your goals. Next, you'll make facial expressions so that we can determine the areas of concern. Then, we'll proceed with the treatment you've chosen.

- **Dermal Filler** – To fill in troublesome lines, the registered nurse will use a fine needle or blunt tip cannula to inject the filler. It will feel like a tiny pinch that lasts just a few moments. Overall, the procedure will take approximately one hour to complete.
- **Botox<sup>®</sup>** – To relax facial muscles for skin smoothness, the registered nurse will use a fine needle to inject the Botox<sup>®</sup>, delivering a minor pinch. The process will take roughly 30 minutes to complete.

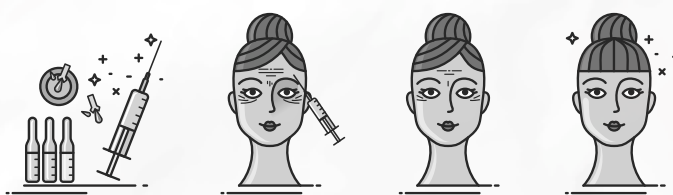

**Botox<sup>®</sup>** – Typically, it takes 7 to 14 days for Botox<sup>®</sup> results to develop fully. These results last 2 to 4 months on average, depending on the injection site and your unique physiology.
